3D STORAGE SYSTEMS – DYNAMIC STORAGE PRODUCTS SPECIALISTS

The installation pictured above shows both pushback and pallet flow in a 4-deep configuration. This layout allows picking aisles to be separate from replenishment aisles.

STEADIFLO PUSHBACK – designed to offer increased storage density with more pick faces than traditional high density storage systems.

3D Steadiflo is available in 2, 3, 4, 5 and 6 deep styles and can be arranged as back to back islands or stand alone bays.

FREESTANDING CARTON FLOW RACKS – Skatewheel Beds are ideal for heavy duty case and carton flow applications. Constructed from 20 gauge material, load-rated at 50 lb. per wheel and mounted on 1/4" shafts. Assembly in a staggered pattern ensures smooth operation. A variety of widths and lengths available to suit specific requirements.

PALLET FLOW – 3D Storage Systems offer a wide range of flow products, from skatewheel to polycarbonate wheels to steel rollers, which are engineered to meet specific needs. The key to successful flow systems is developing a solution that is customized to the type of product to be stored, the pallet type, the environment and the application (picking, staging or storage).
